

PrimedGun Setup Guide

Use this guide with Metroid Prime GCN NTSC Rev 0 (GM8E01) and the recommended DolphinXR build from iChris4.

1 Add Dolphin To Steam

Add Dolphin to Steam as a non-Steam game, then launch Dolphin through SteamVR for VR play.

2 Set SteamVR Video Timing

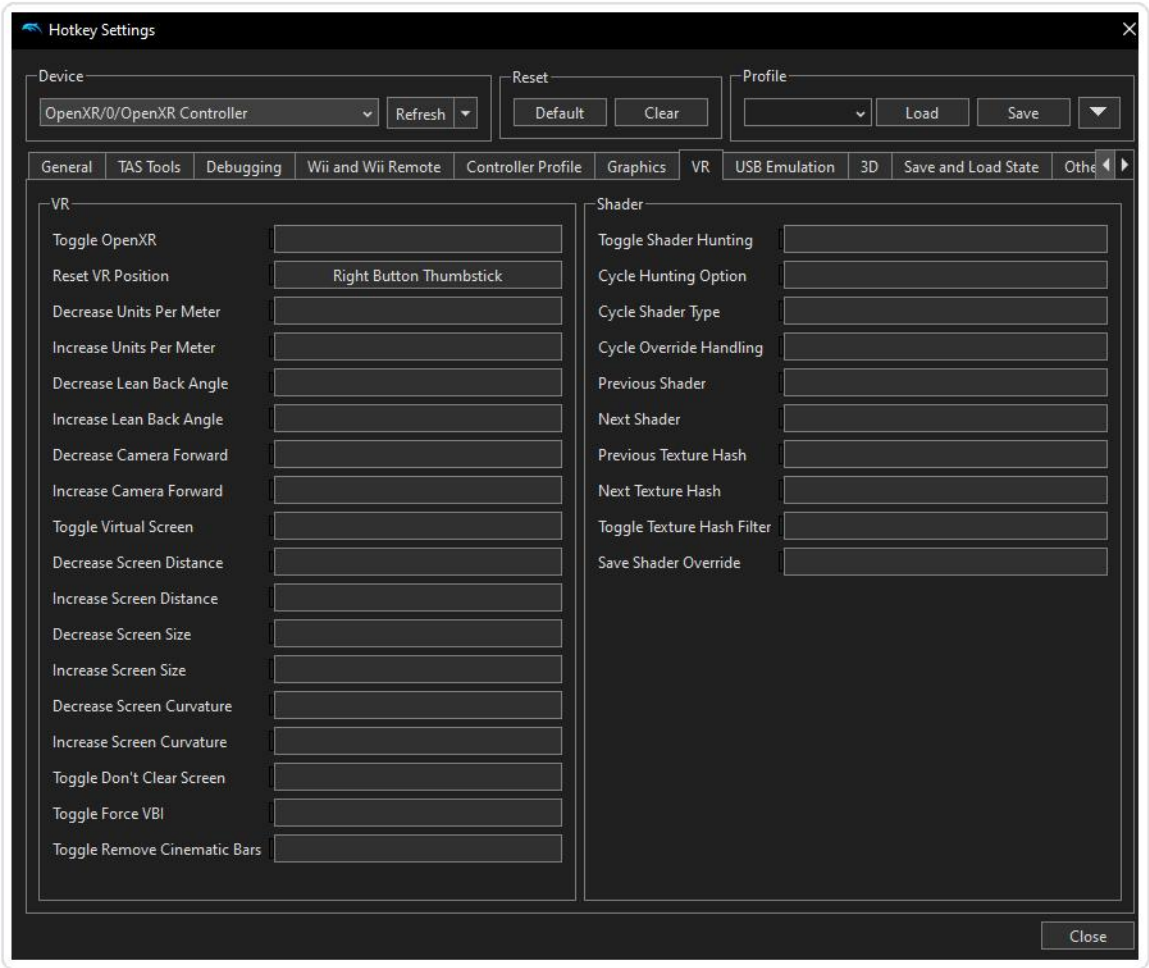

In SteamVR video settings for Dolphin, set throttling behavior to Fixed, lock application framerate to 60 FPS, and use 16.67 ms additional prediction.

Dolphin Hotkey

3 Set Reset VR Position

In Dolphin hotkey settings, right-click the button selection for Reset VR Position, then Clear, then Add Input. Assign your preferred controller input.

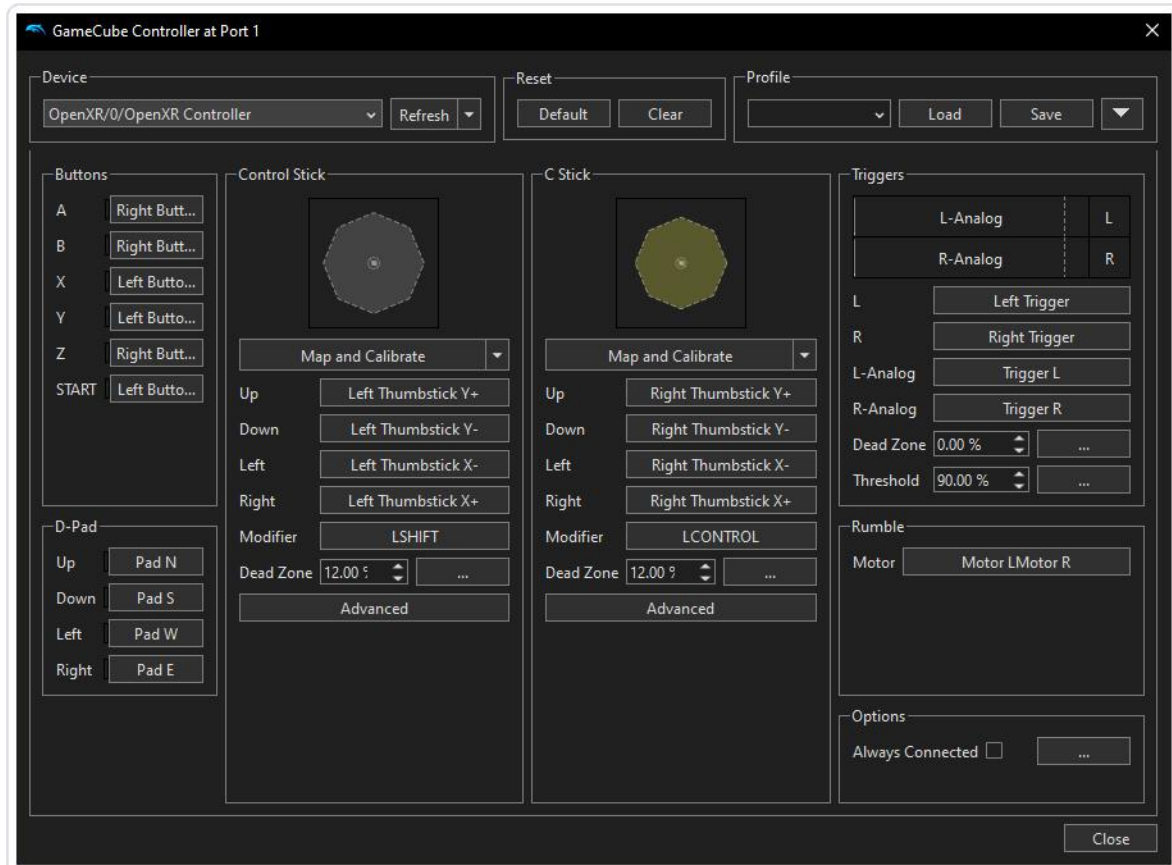

Important: Dolphin hotkeys only register while Dolphin's game window is focused.

Controller Mapping

4 Map Controller Inputs

In Dolphin controller mapping, right-click each button selection, then Clear, then Add Input. D-pad input is not required because PrimedGun can read the control stick as D-pad visor input when the controller is near your head.

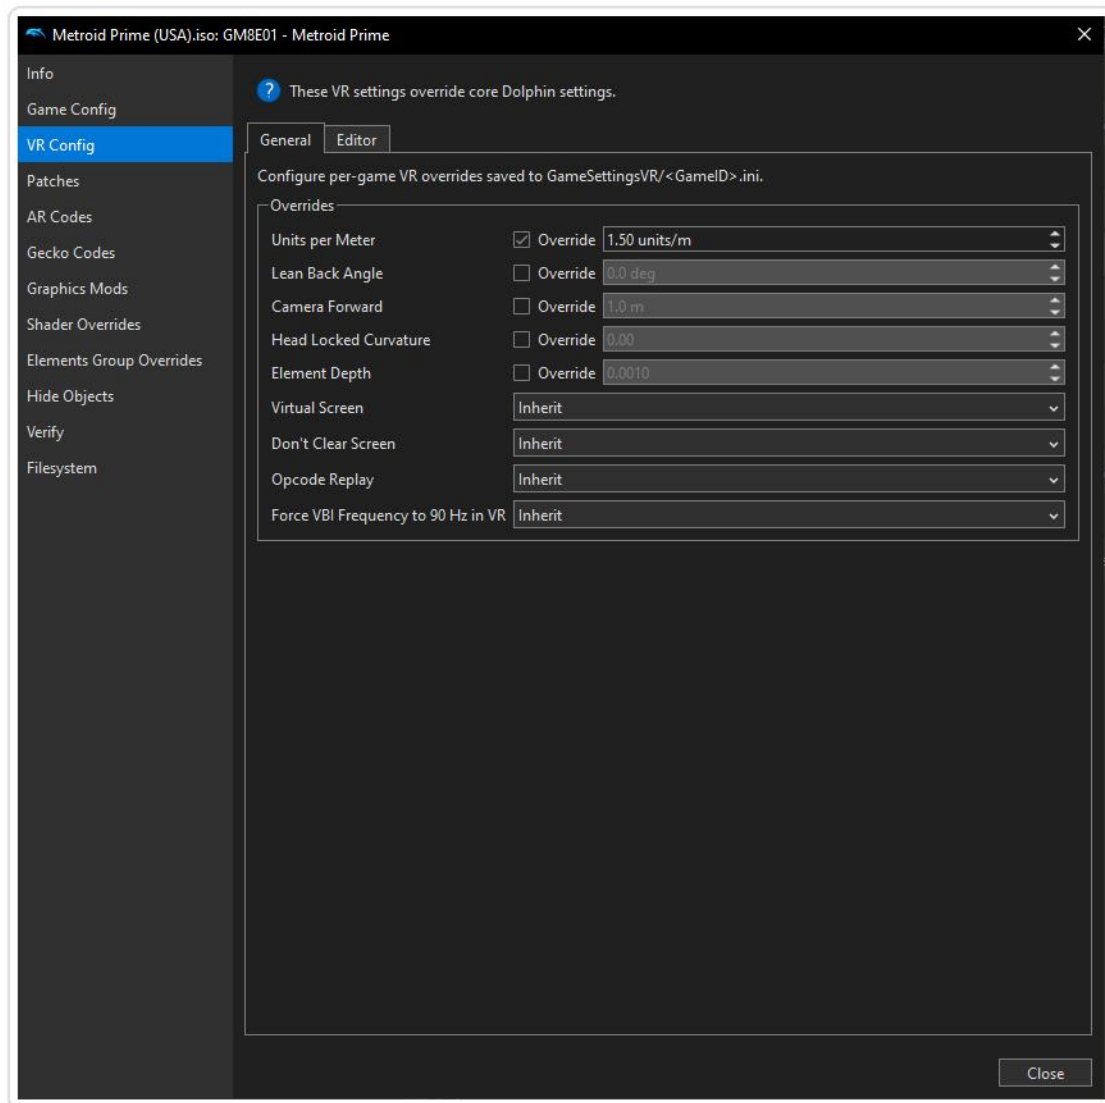

Additionally, offhand controller yaw is used for strafing so full movement follows your offhand direction.

World Scale

5 Adjust World Scale

In Metroid Prime properties, adjust world scale to 1.50 as shown.

Apply all PrimedGun AR codes from the [README](#) before playing.

Usage

1. Start SteamVR.
2. Start Dolphin and load Metroid Prime.
3. Launch PrimedGun.exe.
4. Confirm both Dolphin and OpenVR show as connected.
5. Click INACTIVE to start writing transforms.
6. While moving your head, use Dolphin's reset-view toggle to line the arm cannon up with your controller position.
7. Dolphin's game window must be focused for Dolphin hotkeys to register.
8. If playing seated or standing, adjust the Y axis in Offset Tuning as needed.
